a list of the tubes under development at Zavod	
532.	25

STOP TO

SECRET -3-25X1 this list showed that Zavod 632 was developing the following oscillograph tubes: 3 DP-1 (using polarized deflection); 3 BP-1 (without polarized deflection); a 5" tube with post acceleration. In addition to the above three, the 5 FP-7 for PPI's was on it, and a 3" tube having a long gun. The list contained mostly 3- and 5- inch tubes. It 25X1 was general knowledge that Zavod 632 was also working on 9" and 12" PPI tubes having ground, spherical face plates and. long persistence, and that it was also working on a 7" kine-8. a 16" kinescope, which had a square 25X1 steel cone and employed an electrostatic deflection system. The tube had a low focusing voltage and an ion trap, and the development work, which was being done at NII 160, was almost the Soviets had developed both steel and glass 25X1 kinescopes, but they were not at the stage from which they could be put into production. 25X1 9. Although 25X1 in some departments of NII 160 the Germans helped in preparing Even 25X1 where the Germans did have something to do with the plan, they had influence mostly over the terminal 25X1 dates of the projects rather than over the fiscal details. The Ministry, did not make any rule that 25X1 the Germans have no contact with the plan figures, but two factors inhibited such contacts greatly. First, many of the Soviet department heads would not allow such contacts and, second, most of the Germans were unwilling to accept any responsibility for matters they couldn't later exercise any control over and therefore avoided contact with the budget. 10. 25X1 Tubes in Production Stage in the USSR The only cathode ray tubes in mass production were the 7-inch size. There was a rather large quantity of these being produced. There was limited production of 9-and 12-25X1 For more 25X1 10 to 20 percent. 13. After the Soviet engineers had seen the bad effect of ion bombardment in cathode ray tubes, they decided to incorporate

SECRET 25X1 ion traps in future types. The ion trap, used most frequently, was the Bentgen (DuMont) trap, using a triode system. Most of the tubes were given life tests at 50 microamperes, at which level the life had to be 1,500 hours. The high-pressure mercury lamps used to illuminate the darktrace tubes were exact copies of the old Osram lamp used in Germany during the war for the same purpose. Originally Osrami made a range of these bulbs from 50 to 1,000 watts in size. Later OSW took over production of the bulb. 25X1 worked very well with DC and had a life of about 500 hours. With AC applied to the bulb, however, they did not work nearly as well and the life was reduced to something like 100 or 150 hours. This reduced life was the result of the sputtering of the cathodes which occurred when an alternating voltage was applied. 25X1 Production of Tube Machinery The development of tube making machinery was the responsibility of a section referred to as OKB-M, physically located in the same buildings as NII 160. 25X1 and OKB-M were in the same Ministry but were not in the same chief directorate. The OKB was responsible, however, for the development of all machinery necessary for any chief directorate of the Ministry. it worked on the development of machinery for the automatic finishing of kinescopes. This project was to develop all the machinery for a production line with a capacity of 100,000 cathode ray tubes There was astonishingly good cooperation between Zavod 632 and NII 160 as far as exchange of ideas is concerned. Also, since OKB-M did the development work for machinery for the entire Ministry, OKB-M furnished 632 with plans, 25X1 blueprints, and possibly sample machines for production machinery for this latter plant. During the war, Tungsram of Budapest, Hungary, furnished NII 160 with tube machinery. This was taken from the Hungarian company by the Soviets, These machines were still 25X1 in place in NII 160, '25X1

Glass Supply to NII 160

18. The glass supply at NII 160 came from three sources: A plant in Zaprudnaya, a plant in Moscow, and the Institute's own glass plant. Considerable difficulty was experienced with the glass from the Institute's own plant. the glass plant had capacity enough to supply all the glass that was needed by the Institute, but the quality was very poor, hence
